Energy consumption

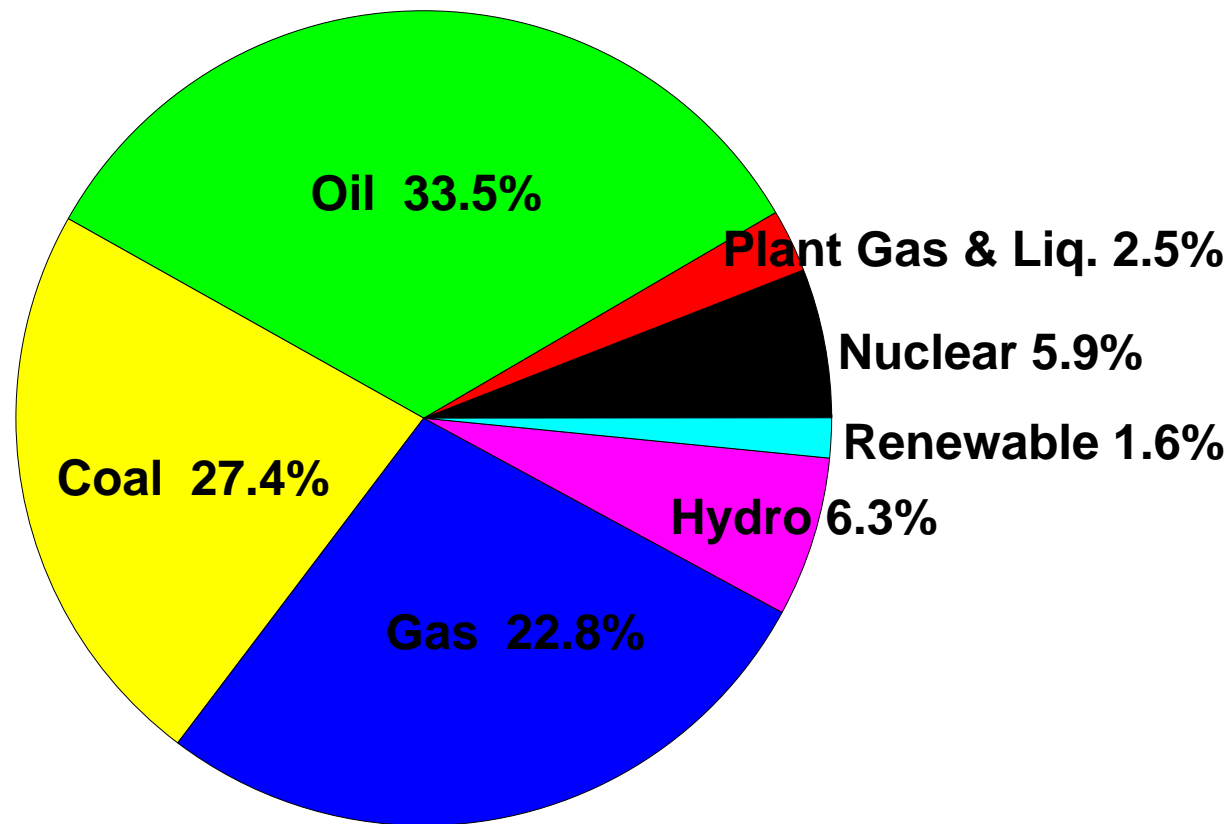

# INTRODUCTION

## Energy Types

World Energy Production in 2006

University of Pretoria

**Note: fossil fuels represent about 84% of the total.**

# NUCLEAR REACTORS

University of Pretoria

U.S. Department of Energy's Office of Nuclear Energy, Science and Technology:

## Generation IV Nuclear Reactors

- Sustainability
- Economical
- Reliability
- Proliferation-resistance
- Safety – Self-regulating – no Chernobyl

# SA PBMR Reactor

University of Pretoria

- Improvement of German design (21 years running)
- Outlet working temperature – 950°C  
TD efficiency higher than conventional nuclear reactors. Self-annealing of irradiation damage.
- Moderator and neutron reflector are from graphite
- Inherent safety self regulation mechanism  
Reason: Doppler broadening of neutron fission reaction cross-section peak

# SA PBMR Reactor

University of Pretoria

- Direct cycle reactor (Brayton cycle)  
No heat transfer system
- Coolant is He gas
- Small reactor: 250 or 400 MWth

Suitable for urban development

Reactor design: Seldom stoppages (Normal

LWR - 18 to 24 months fuel replacement)

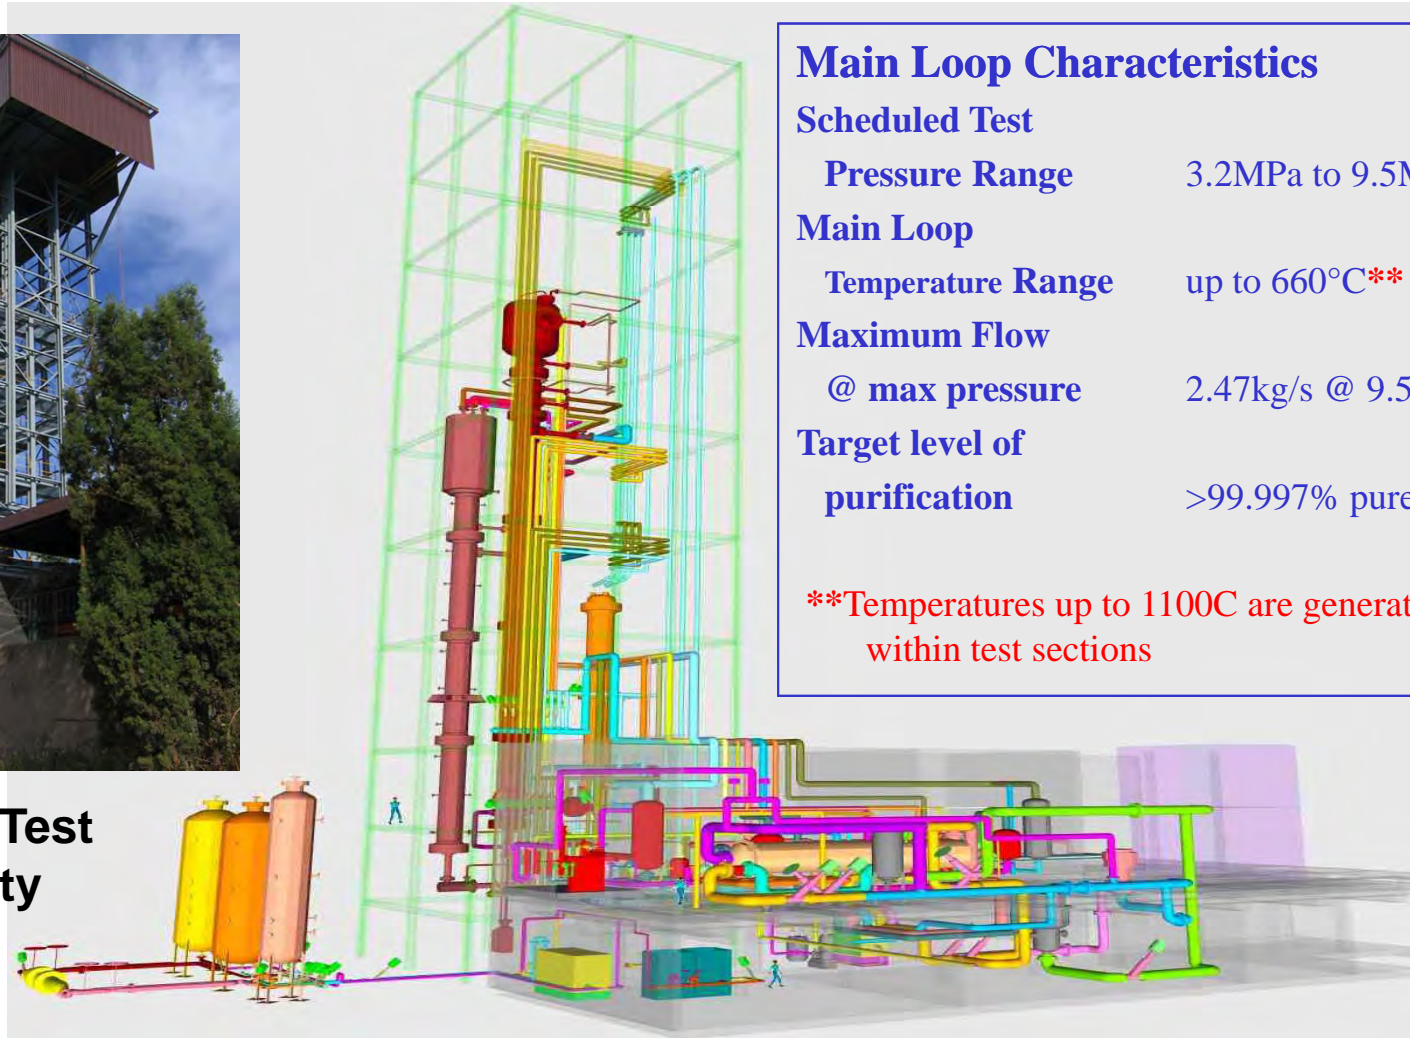

# SA PBMR Reactor

University of Pretoria

**Helium Test Facility**

## Main Loop Characteristics

### Scheduled Test

Pressure Range 3.2MPa to 9.5MPa

### Main Loop

Temperature Range up to 660°C\*\*

### Maximum Flow

@ max pressure 2.47kg/s @ 9.5MPa

### Target level of

purification >99.997% pure He

\*\*Temperatures up to 1100C are generated within test sections

# SA PBMR Reactor

University of Pretoria

## Unique feature of PBMR

Fuel elements – TRISO particle & pebble

Containment of radioactive nuclides

# SA PBMR Reactor

## FUEL ELEMENT DESIGN FOR PBMR

retoria

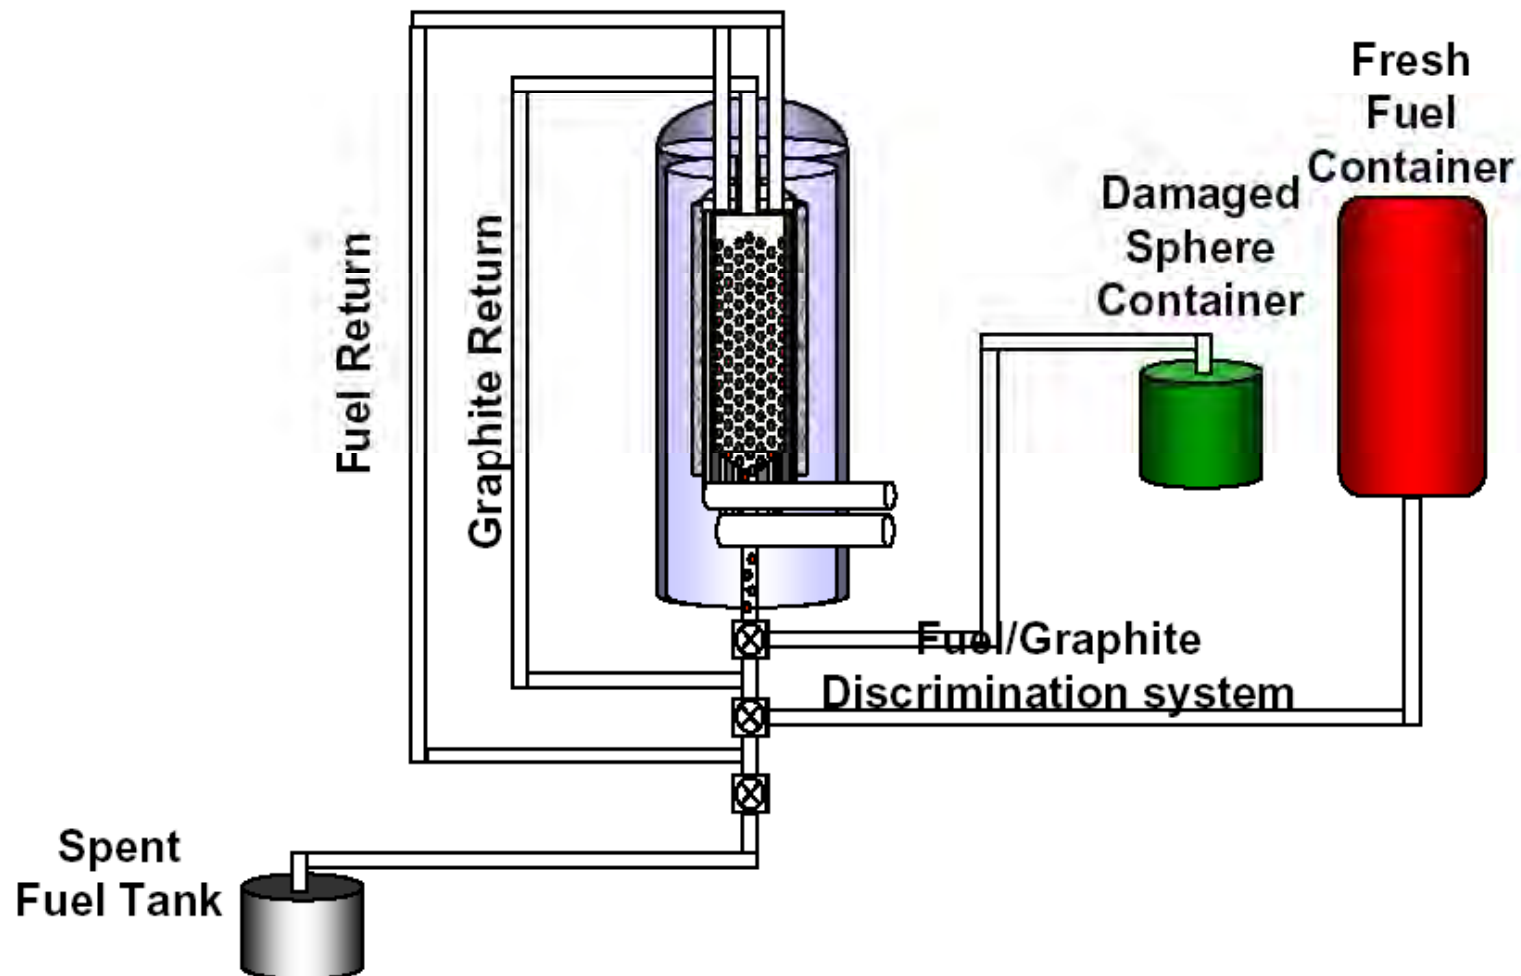

# SA PBMR Reactor

University of Pretoria

## Movement of pebbles through the reactor

# SA PBMR Reactor

University of Pretoria

## Containment of radioactive nuclides

### Some statistics for 110 MWe reactor

- ◆ 360,000 pebbles in core
- ◆ About 3,000 pebbles handled by FHS each day
- ◆ About 350 pebbles are discarded daily
- ◆ One pebble discharged every 30 seconds
- ◆ Average pebble cycles through core 10 times

Fuel handling is most maintenance-intensive part of plant but is handled automatically

# SA PBMR Reactor

University of Pretoria

## Schematic outlay

TRISO on the  
head of a pin**

# SA PBMR Reactor

University of Pretoria

## Size of the TRISO particle

**Dissected particle on point of a pin. Piece of cake?**

# Buffer & IPyC layers

University of Pretoria

## Buffer layer

- Absorber of recoil fission products
- Traps fission gases
- Absorbs thermal stresses

## IPyC

- Similar to buffer layer
- Growth layer for SiC layer
- Diffusion barrier for some elements

# IPyC layer

University of Pretoria

Chemically etched IPyC  
Microstructure: Spheres with openings in between  
Traps fission gases & Absorbs thermal stresses

# IPyC layer

University of Pretoria

Inner microstructure: Concentric hollow “spheres”  
Functions: Gas absorption & accommodation of thermal expansions and contractions.

# SiC layer

University of Pretoria

- Main diffusion barrier for fission products.
- Mechanical strength and rigidity to particle

Stronger bonding between IPyC and SiC than with OPyC. SiC: faceted crystals - columnar growth (arrows).

# SiC layer

a

SiC layer on glassy carbon (Sigradur®) substrate.  
Contact layer - very small SiC crystals. Increasing thickness - larger SiC crystallites form columnar structure.

# SiC layer

University of Pretoria

Twins T  
Stacking faults SF

Defects necessary  
for mechanical  
strength.

Chemically etched SiC at SiC/OPyC interface showing substrate for epitaxial layer. Homo-epitaxy: crystal continues to grow. Epitaxy: a new poly-type. Magnification bar is 200 nm.

# SiC layer

University of Pretoria

Chemically etched  
SiC at SiC/OPyC  
interface.

Circle: Uneven etching near stacking faults. Note different etching patterns: rough R and smooth S on different faces of twinned crystals - different chemical properties of the Si and C faces of SiC crystals.

# SiC / IPyC interface

University of Pretoria

## Conclusion

OPyC layer less strongly bonded to SiC layer

Mechanical shocks to TRISO: OPyC layer breaks loose keeping SiC layer (i.e. main diffusion barrier) intact thereby keeping radioactive fission products from escaping.

# OPyC LAYER

University of Pretoria

## Main functions of OPyC layer

- Protect SiC from external gas reactions during manufacturing.
- **Another barrier for gaseous fission product release.**
- Provide compressive pre-stressing of SiC layer.
- Protect SiC layer during handling.

Microstructure of OPyC is similar to IPyC. Also cavities and spherical PyC.

# SA PBMR Reactor

University of Pretoria

## Functions of the layers

- Inner porous graphite
  - Absorption of gaseous fission products
  - Thermal expansion
- Inner pyrolytic graphite
  - Absorption & growth basis for SiC layer
- SiC
  - Fission product containment (diffusion barrier)
  - Strength
- Outer pyrolytic graphite
  - Protection

# SA PBMR Reactor

University of Pretoria

## Radiation damage

Channeling: Room temperature bombardment – amorphization  
600°C bombardment – no radiation damage

# SUMMARY

## Energy crisis

- Nuclear power plants are coming back into fashion.
- Generation IV nuclear power plants: PBMR

## PBMR design

- Containment of radioactive nuclides - fuel
- Safe: self-regulating

## Coated fuel particles

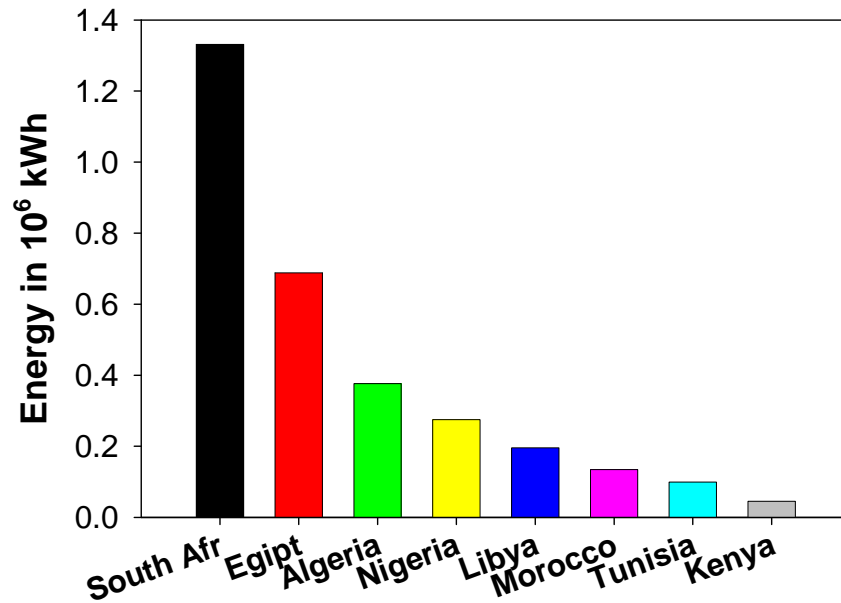

- Carbon layers – gas containment
- SiC layer diffusion barrier for metals

# Africa's Energy Consumption

University of Pretoria

### Total Energy Consumption in 2003

### Energy Consumption per Capita in 2003

# Energy crisis in fossil fuels

University of Pretoria

**Table1:** *2003 World & USA proven fossil fuel reserves profitably recoverable with current technology.*

<b>Resource</b>	<b>World Reserves</b>	<b>USA Reserves</b>	<b>Lifetime*</b>
	<b><math>10^{15}</math> kWh</b>	<b><math>10^{15}</math> kWh</b>	<b>Years</b>
Oil	2.050982	0.03516	10
Gas	1.582186	0.055669	9
Coal	7.910929	2.050982	250
Oil Sands	0.439496	0.03516	8

\*Lifetime: USA reserves/USA 2003 production rate.

# Energy crisis in fossil fuels

University of Pretoria

## Conclusions from Table

- ❖ Limited lifetime for world's fossil fuel.  
(Profitability)
- ❖ Enhanced by increasing affluency of countries.
- ❖ Coal not a medium term solution:
  - # Kyoto Protocol
  - # Radioactivity
  - # SO<sub>2</sub> – acid rain

# Renewable energy option

University of Pretoria

**Table 2.** *Renewable energies and applications.*

<b>Type</b>	<b>Application</b>
Solar energy	Thermal: Heating and cooling buildings, Domestic hot water, swimming pools, solar furnaces. Electricity: Photovoltaics
Wind energy	Electricity: Wind turbines Mechanical: Water pumping, grinding

# Renewable energy option

University of Pretoria

**Table 2.** *(Continued)*

<b>Type</b>	<b>Application</b>
Hydro energy	Electricity: Turbines Mechanical: Water wheels
Biomass	Heat: Direct combustion Electricity Fuels: gas, liquids
Geothermal energy	Electricity via turbines Heat: central heating.
